Human Evi27 gene was mapped to chromosome 3p21. Evi27 is a common site of retroviral integration in BXH2 murine myeloid leukaemias. Evi27 cDNA sequences are useful as antisense molecules to inhibit Evi27 protein or for chromosomal compaping or mutational analysis of Evi27 protein. They are proviral integration sites associated with leukaemias and monitoring this site provides a genetic tag for disease gene identification. The proteins of the invention are useful to stimulate the secretion of proinflammatory cytokines such as IL-8 and plays an important role in the developmental and/or disease processes of haematopoietic cells. Hence modulating the expression of Evi27 at the RNA or protein level is used in the treatment of diseases such as cancer corautoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 100.0%; Score 1827; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of II-17 protein in an animal. The II-17 protein is useful for treating, preventing or ameliorating a disease, such as immune system dysfunction (rheumatoid arthritis, osteoarthritis, inflammatory joint disease); autoimmune (multiple sclerosis, lupus, diabetes, inflammatory bowel disease, transplant rejection, graft vs. host disease); infections (HIV, (hepatitis, bacterial); weight disorders (obesity, anorexia, cachexia, sepsis); neuronal dysfunction (Alzheimer's, Parkinson's disease); lung (acute respiratory distress syndrome, cystic fibrosis, emphysema); skin (psoriasis, eczema, wound healing); kidney (glomerulonephritis); bone (osteoporosis, Paget's disease, hypercalcaemia) vascular system (epilepsy atherosclerosis, heart failure, angiogenesis); tumours, cancers (lymphoma leukaemia); reproductive (inflammation. The present sequence is human Interleukin-17 receptor B-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

```
The present invention relates to novel human nucleic acids encoding interleukin 17 (IL-17) receptor like proteins. The present sequence is one such coding sequence. The IL-17 receptor-like proteins and coding sequences are useful for treating a pathological condition related to immune system dysfunction (e.g. psoriatic arthritis), infections (e.g. viral infections), weight disorders (e.g. obesity), neuronal dysfunction disorders (e.g. asthma), skin disorders (e.g. aczema), kidney disorders (e.g. glomerulonephritis), bone disease (e.g. osteoporosis), vascular system disorders (e.g. sischaemia), eye disorders, reproductive disorders, tumours and
                                                                                                                                                                                                                                                                                                                                                     Jing
                                                                                                                                                                                                                               Three human nucleic acids encoding interleukin 17 (IL-17) receptor polypeptides, useful for treating, diagnosing, ameliorating or preventing immune system disorders (e.g. psoriatic arthritis) and infections (e.g. viral infections) -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antipsoriatic; antimicrobial; anoretic; nootropic; neuroprotective; antiasthmatic; antiallergic; dermatological; cytostatic; gene therapy: interleukin 17; immune system disorder; infection; weight; reproductive neuronal dysfunction; lung; asthma; skin; eczema; kidney; inflammation; glomerulonephritis; bone; osteoporosis; vascular system; ischaemia; eye

Isolated antigenic human or mouse DNAX receptor subunit-like polypeptide useful for detecting antibodies generated in response to presence of increased protein levels or immunological disorders -

Disclosure; Page 7-10; 148pp; English.

The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents cDNA encoding the human DCRSS polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess foreign conversity, and for nutritional purposes. The present sequence is a cDNA biodiversity and for nutritional purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tang Y'

The present sequence is human protein with hydrophobic domain encoding CC cDNA clone HP10758. The polynucleotide and polypeptide of the invention CC may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate polypeptide expression. The polynucleotides CC into a host cell and culturing the cell to express the protein. The CC polynucleotides and its complementary sequences may also be used as DNA CC probes in diagnostic assays and also used in gene therapy. The CC polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators of polypeptide expression and CC activity. The polypeptides and nucleic acids may be used as nutritional consultate immune stimulation or suppression (e.g. for the treatment of microbial infections and autoimmune disorders such as multiple sclerosis, complements to madulate the manufacturity and insulin-dependent diabetes), to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             06-JAN-2000;

                                                                                                                                                                                                                                                                                                                               The patent relates to novel interleukin-17-like receptor

controlled in (IL-17RLP). IL-17RLP is a homologue of the II-17 receptor and has

a wide range of cytokine receptor-like activities. IL-17RLP or its

consists may be used to enhance host defenses against resistant chronic

and acute infections, e.g. mycobacterial infections, via the attraction

and activation of microbicidal leukocytes. It may also be used to

increase T-cell proliferation by stimulating IL-2 biosynthesis, for the

treatment of T-cell mediated autoimmune diseases and lymphocytic

treat sepsis. IL-17RLP may also be used to regulate hematopoiesis and to

treat sepsis. Extracellular IL-17RLP domains may be used as antagonists

of IL-17RLP. IL-17RLP agonists and antagonists can also be used to

modulate IL-6 expression, useful in treatment of cancers such as

myelomas, plasmacytomas and hybridomas and Lennert's Lymphoma. The

present cDNA sequence encodes human II-17RLP. This cDNA sequence was

derived from sequencing the HAPORAO cDNA clone (ATCC deposit

The IL17RLP polypeptide is useful for screening f agonists and antagonists. These antagonists and agonists are useful treating, diagnosing, detecting and or preventing disorders related cellular activation, haemostasis, angiogenesis, tumour metastasis, cellular migration, ovulation or neurogenesis, such as osteoporosis, arthritis and autoimmune disorders e.g. systemic lupus erythromatosu

IL-17RLP or its agonists may be used to enhance host defenses against resistant chronic and acute infections, e.g. mycobacterial infections, via the attraction and activation of microbicidal leukocytes. It may also be used to increase T-cell proliferation by stimulating IL-2 biosynthesis, for the reatment of T-cell mediated autoimmune diseases and lymphocytic leukaemias. IL-17RLP may also be used to regulate hematopoiesis and to treat sepsis. Extracellular IL-17RLP domains may be used as antagonists of IL-17RLP. IL-17RLP agonists and antagonists can also be used to modulate IL-6 expression, useful in treatment of cancers such as myelomas, plasmacytomas and hybridomas and Lennert's Lymphoma. The present cDNA sequence encodes human IL-17RLP. This cDNA sequence was discovered in a cDNA library derived from human adult pulmonary tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1816 BP; 532 A; 439 C; 399 G; 445 T; 1 other;

                                                                     The present sequence encodes human interleukin 17 receptor like protein (II17RLP), isolated from a cDNA library of human adult pulmonary tissue. II17RLP and its agonists can be used to treat disorders relating to cellular activation, haemostasis, angiogenesis, tumour metastasis, cellular migration and ovulation, and neurogenesis. They can also be used to enhance host defences against resistant chronic and acute infections, e.g. mycobacterial infections via the attraction and acute cativation of microbial leukocytes. IL17RLP may also be used to increase T-cell proliferation by the stimulation of IL-2 biosynthesis for the treatment of T-cell mediated autoimmune diseases and lymphocytic differentiation of various haematopoietic progenitor cells, e.g. to cellase mature leukocytes from the bone marrow following chemotherapy, i.e. in stem cell mobilisation or to treat sepsis. The products can also be used for the diagnosis or treatment of immune system related disorders e.g. tumours, cancers, interstitial lung disease, and any disregulation of immune cell function including autoimmunity, arthritis, leukaemias, lowell disease or myell suppression, immunity, humoral immunity, inflammatory
